

$$\sqrt{(x_i - x_j)^2 + (y_i - y_j)^2}.$$

convert to math.h c code

Use `sqrt()` and `pow()` from `math.h`:

```
</> C  
#include <math.h>  
  
double distance = sqrt(pow(xi - xj, 2) + pow(yi - yj, 2));
```

Better C version without `pow()`:

```
</> C  
#include <math.h>  
  
double dx = xi - xj;  
double dy = yi - yj;  
  
double distance = sqrt(dx * dx + dy * dy);
```

Use this when `xi`, `xj`, `yi`, and `yj` are `int` or `double`.
