

rewrite my best distance function to work for expected output and have better run time

```
distance* best_distances(  
    distance* distances, int num_best_dist, int num_distances  
)  
{  
    distance* best_distances = malloc(num_best_dist*sizeof(distance));  
    int* used = calloc(num_best_dist*2, sizeof(int));  
    //these count variables will make sure that only num_pairs amount of distances are in final array  
    int current_spot = 0;  
    int current_best_spot = 0;
```
